

## RAILMOBILE

### **Real-time digital communications portal for all documentation.**

RailMobile is a two-way communications platform that collects, organises, distributes and manages all personnel documentation, including shift information and verification/updating of training and qualifications. The system digitally controls the flow of documents, enabling operators to monitor and manage distribution to staff based on skills and document type. RailMobile centrally manages the delivery of technical documents on staff devices, including the distribution of updates and registration of acceptance and delivery.

### **Key Benefits:**

- **Efficiency and Productivity:** Automation of personnel document management and providing employees with real-time access to their information frees employees to prioritise important tasks, e.g., operating trains or performing maintenance.
- **Safety and Regularity:** Staff responsible for document distribution can track document acceptance in relation to validity periods.
- **Communication and Collaboration:** Data forms make it possible to ask employees for feedback, or request assistance from other departments.
- **Employee Satisfaction:** Continuous access to documentation at all times – both online and offline.
- **Environmental:** Digitising rail processes, documents and train cards reduces use of paper. In Italy alone Binary System has saved 1.2 billion printed pages – more than 150,000 trees.

### Functionality Highlights:

- **Training:** Employees can access their training records, track progress and identify additional needs.
- **Works Offline:** RailMobile documentation is available even in areas with no Internet connection.
- **Data Forms:** Custom forms collection and related automatic sharing between employees and reference offices.
- **Train Card Management:** Safety documentation is always available and updated on board.

### Other Features:

- **Train Documents:** It allows users to interface with the infrastructure manager and request train documents and prescriptions via mobile or web.
- **E-learning:** Manages learning and helps instructors monitor and control the learning process.
- **SKT:** Generate, on the basis of 'master' information, training documents in .xml format that can be requested by drivers via the mobile app.

## FIND OUT MORE

**Softrail** is the premier solution crafted specifically for railway companies, proven to deliver **cost savings** through smart resource allocation, **enhanced safety** measures via predictive risk analysis, and a workforce empowered with **actionable, real-time insights**.
